Bone Health and Osteoporosis Program

OSTEOPOROSIS, also known as brittle bone or porous bone, is a disease characterized by low bone mass, which makes bones more likely to break. Up to 50 percent of women and 25 percent of men will sustain fragility fractures—broken bones caused by little or no trauma, such as a fall from standing height—often associated with osteoporosis.

The Queen’s Orthopedic and Spine Center has partnered with the American Orthopaedic Association’s Own the Bone program, a national quality improvement initiative to address the osteoporosis treatment gap and prevent fragility fractures like the one you have from recurring.

What is The Queen’s Bone Health and Osteoporosis Program?

The Queen’s Bone Health and Osteoporosis Program, through its partnership with Own the Bone, is dedicated to improving patient health by:

• Preventing future fragility fractures to the back, hip, pelvis and wrist

The program services patients who have sustained a fragility fracture due to a fall from standing height or less, or in the absence of obvious trauma.
